This article was written by Daniel Graf and originally published at InformationWeek In this piece, we look at how the auto industry will evolve, as well as how an electric car manufacturer's process for designing batteries will change. The auto industry is undergoing a massive transformation as new technologies improve, costs and standards fall, and consumer attitudes shift. Business and government agencies are getting involved as well; the European Union (EU) has defined a European Platform for Electric and Hybrid Vehicles (EPEV), which includes almost all European countries except France, and a World Economic Forum study has predicted that by 2050, 50% of the world's GDP will be made up of connected vehicles. Other factors driving innovation in the automotive industry include the globalization of automakers, the rise of regulatory regimes, the development of autonomous vehicles, and the increasing scope of the Internet of Things. To understand how these developments are changing the automotive industry, it's important to understand the way the auto industry has worked historically. While the car industry has undergone substantial change, it remains based on the four basic elements of production: 1. People making cars. 2. Equipment, or tools, for making cars. 3. Materials to make cars. 4. Vehicles to transport people and equipment to make cars. We've put together a table that summarizes each element of this process. Click to enlarge Most of the industry's growth has been in the first element of production, and not in the elements of purchasing, logistics and sales. Production has been stagnant over the past century, and most of the car companies we know today are fairly new, with the industry growing at a rate of 1.5% per year. The current financial crisis is impacting many aspects of the auto industry, but the crisis hasn't been enough to fundamentally change the nature of the industry. Moreover, the process of automobile manufacture has remained relatively unchanged since the introduction of Henry Ford's assembly line in the early 1900s. Cars are still produced in a relatively linear way, with most of the internal structure, systems and controls remaining the same. Most of the industry's growth has been in the first element of production, and not in the elements of purchasing, logistics and sales. In contrast to the traditional method of automobile production, recent developments are demonstrating how one company is designing and producing a vehicle in an entirely different way. This could

The National Liberation Front of Tripura (NLFT), a Marxist-Leninist group, has carried out a string of murders over the past three years, including one in which an American was killed. The suspected culprits were all members of the NLFT. In March 2017, a man was shot dead at a hotel in the Northeast Indian state of Tripura. The deceased, Henry Madia, was an American citizen and a member of the International Brigade, a right-wing group that fights communism. The NLFT claimed responsibility for the killing of Madia and some other foreigners, and sought to recruit new members among the Americans who live in India. The NLFT also distributed flyers and notes at schools 5b5f913d15
