The aim of this review was to examine critically the effectiveness of the various forms of therapy used in the management of post-transfusion hepatitis (PTH) B in adults. From review of the literature, it appears that antiviral therapy is highly effective in producing a long-term remission of the disease in persons with chronic hepatitis B with a nucleic acid test (NAT) conversion rate of over 90% during a period of 10-12 weeks. It is also effective in inducing a sustained virological response rate of 80-100% in a patient-controlled study. However, viral resistance has been reported in patients with chronic hepatitis B and reversion of anti-HBe antibody to anti-HBe or anti-HBe and anti-HBs to anti-HBs has been reported after an initial good response. Both interferon-alpha and lamivudine are effective in producing a sustained biochemical response and have been used in randomized controlled trials to assess the importance of viral and biochemical parameters in predicting the long-term outcome in those patients with long-term follow-up data. When long-term outcomes were compared in patients treated with lamivudine and those treated with interferon-alpha, there was no significant difference. It is clear from this review that antiviral therapy is effective in treating hepatitis B and allows an adequate analysis of the prognostic significance of viral and biochemical parameters. It seems likely that antiviral therapy will be used for the treatment of post-transfusion hepatitis B. The only three randomized trials comparing the efficacy of interferon-alpha and lamivudine in the long-term management of hepatitis B have demonstrated no significant difference in the long-term outcomes between these two treatments.The present invention relates to a torque converter that comprises a rotor case and a cover arranged in the rotor case to be capable of closing and opening at least partially, where between the cover and the rotor case is arranged a shaft sealing ring.
