KFC is a publicly traded company and information about the business, financial and legal affairs of KFC may be found on the Internet at The information provided in the KFC website is not intended to be used as a substitute for professional advice. To reach a human for questions about specific donations, please contact KFC at 502.569.1745 or visit the customer service department at your local KFC restaurant. Q: Can I hide a button from the title bar of my vsto app? I'm developing a Windows Store app using Visual Studio 2017. I have created a button in the title bar and I have given it a specific style with an image attached. Is there a way to hide this button or will it always show? A: If I understand the question correctly, the question is about whether or not a certain button will always be visible in the ApplicationBar for the entire time the app is running. The answer is NO. Microsoft provided an example of this in the Windows App Studio Templates. There is a button in the bottom right hand corner of the ApplicationBar for closing the application. This is visible in all states and can be used to close the application. This button is not visible in any of the 3 template States. In a State where the app is minimized, this button is only visible when the app is active, and in a State where the app is maximized, this button is only visible when the app is active.
