Field of the Invention The present invention relates to a magnetic disc drive and more particularly, to a technique for providing a disc drive having a plurality of magnetic heads, all of which are disposed below the inner edge of the magnetic disc. 2. Description of the Prior Art In the magnetic disc drive, a head supporting mechanism called as a rotary-type actuator is widely employed. The rotary-type actuator has a magnetic head supporting arm rotatably disposed above a rotating magnetic disc. A slider is attached to the top end of the magnetic head supporting arm. A magnetic head is attached to the bottom surface of the slider. The magnetic head is adapted to be attached to the magnetic disc surface by way of a slight contact. In the conventional magnetic disc drive, the magnetic head is mounted to a predetermined height above the surface of the rotating magnetic disc and the magnetic disc is moved relative to the magnetic head. The magnetic head is moved from one position to another position in a radial direction of the magnetic disc. On the other hand, the magnetic head is moved relative to the magnetic disc without being lowered from a predetermined height.

The rotary-type actuator is adapted to provide the magnetic head with a predetermined flying height above the magnetic disc. The magnetic disc drive is further provided with a motor for moving the rotary-type actuator in the radial direction of the magnetic disc, a voice coil motor for moving the magnetic head in the radial direction of the magnetic disc, and a head position controller for controlling the motion of the rotary-type actuator and the voice coil motor. In the magnetic disc drive, the rotary-type actuator is constructed such that the magnetic head supporting arm is rotatably supported in a pivotable manner and the slider is attached to the top end of the magnetic head supporting arm. The slider is constructed such that the magnetic head is mounted to the bottom surface of the slider. A fluid bearing is disposed between the slider and the magnetic disc. When the magnetic disc is rotated at a high speed, a high pressure air is 2d92ce491b
