So can someone please explain to me what I'm missing, I've tried reinstalling and yet it's not working. A: You should make sure you're not blocking access to your website with the TeamSpeak 3 server IP address in the Deny... I can't remember which one it is. Make sure your website is listed in the Allow... lines in the following file. %localappdata%\Microsoft\WebsiteCache\

Enhancement of enzyme production and the enzymatic degradation of 2,4,6-trinitrotoluene using inorganic carbon and nitrogen supplements. This research investigated the application of inorganic carbon (gaseous CO_2) and nitrogen (NH_4NO_3) for the enhancement of the production of the lignolytic enzyme, phenol oxidase (POD) by Bjerkandera adusta ssp. adusta. The addition of gaseous CO_2 during the cultivation of the fungus was effective in enhancing POD production. However, this effect was significantly decreased with increasing initial substrate concentrations. The addition of NH_4NO_3 was effective in enhancing POD production, especially at low initial substrate concentrations. In fact, at an initial substrate concentration of 0.2 g/L, the maximum POD production by B. adusta ssp. adusta was 3.9-fold greater when the fungus was cultivated with added NH_4NO_3. Since the fungus metabolized this added NH_4NO_3, the production of intracellular enzymes (acid phosphatase and protease) was decreased, whereas that of an extracellular enzyme (amylase) was not affected by this phenomenon.Q: Play Framework is not including the configuration file into the build I'm using Play Framework 1.2.4 and I'm trying to deploy a jar to the apache server. My build.sbt looks like this name := "helloworld" version := "0.1" lazy val root = (project in file(".")).enablePlugins(PlayScala) scalaVersion := "2.10.4" libraryDependencies ++= Seq(javaCore, javaJdbc, f3e1b3768c
