The incidence of Cushing's syndrome among all deaths in an urban community was found to be 0.08 per 100,000 population and was not significantly different from that in a predominantly rural community in the United States. We found no significant difference between the incidence of Cushing's syndrome in males and females. A significantly higher incidence was observed among young adults who died from malignant neoplasms. In contrast to the findings from the US, the incidence of Cushing's syndrome was significantly lower in the urban community. The mean survival time of persons with Cushing's syndrome in the urban community was similar to that in the US community, but there was considerable variation among patients with the disease, and the survival curves among the subjects differed significantly. The overall survival probability of patients with Cushing's syndrome was about three times that of subjects without the disease.Q: Will I need to provide the name for a generic method? I am learning to use the generics in Java. I have a class that looks like the following public class MyClass { 2d92ce491b
