System Requirements. Windows XP MCE. Win XP Media Center Edition 2005. original Windows XP Media Center Edition 2005 ISO. Microsoft Windows XP MCE. Free ISO download. May 7, 2018 Microsoft Windows XP Media Center Edition 2005 SP1 Jun 22, 2020 Windows XP Media Center Edition 2005 [w/ Service Pack 3]. Google Chrome was the default browser on Windows XP, but now that Chrome. The present invention generally relates to an electrical interconnect device and more particularly to a device for providing interconnects between two electrical components. In the electrical industry it is common to provide connections between two electrical components. One common way of providing such connections is with wire leads or wire bonds. More particularly, a wire lead is a lead that electrically connects a first electrical component to a second electrical component. One conventional method of connecting a wire lead to a first electrical component is by hand soldering. However, manual soldering techniques are tedious, time consuming, and have a high failure rate. Another conventional method of connecting a wire lead to a first electrical component is with a machine. More particularly, a machine for connecting a wire lead to a first electrical component is typically referred to as a wire bonder. Conventional wire bonders have a bonding head that is typically about four inches wide and approximately five inches long. In order to properly connect a wire lead to a first electrical component, the bonding head of the wire bonder must be properly aligned with the first electrical component. One conventional way of aligning the bonding head of a wire bonder is with a mechanical alignment system. One conventional mechanical alignment system is provided by the GenRad Corporation and is disclosed in U.S. Pat. No. 5,594,285. This conventional mechanical alignment system has a rigid first component and a rigid second component. A solder connection is made between the first component and the second component. One drawback of this conventional mechanical alignment system is that it cannot be used in high current applications. Another drawback of this conventional mechanical alignment system is that it is cumbersome. Another drawback of this conventional mechanical alignment system is that it cannot be used with an industrial robot. Yet another drawback of this conventional mechanical alignment system is that it can only be used with a low pin count devices. The present invention is directed to a device for providing electrical connections between two electrical components. The present invention overcomes one or more of the drawbacks of conventional mechanical alignment systems. Feasibility and Acceptability of Prehabilitation in Patients Undergoing
