File structure An AutoCAD file is a collection of objects, such as lines, planes, and curves, that are stored in one or more objects that are saved in a special file. The objects are grouped into one or more drawing sets. The objects are saved in a hierarchical manner in the file. The tree structure of the objects is similar to that of a word processing file. Files typically contain a single drawing, but some files may contain several drawings. Each object or drawing has an associated tag

File formats Autodesk has designed several file formats, including those used to exchange, store, and print AutoCAD files. Text format The AutoCAD text format was introduced in AutoCAD 2007. It supports plain ASCII and UTF-8 character encodings for text. It also supports Markdown for table-like content. XML elements are used to specify the contents of files, including objects and drawings. By its version, most text in AutoCAD is imported to and exported from.dwg or.dxf (Drawing Exchange Format) files. However, it can also import and export from other native files formats, including.dwf (the Windows native file format), plain ASCII files, and.LISP files. To import text from other sources, an AutoCAD user must open the.dwg or.dxf file with their source application. If the source file is plain ASCII, a user may import the text directly. AutoCAD also supports export to.dwg or.dxf (Drawing Exchange Format) or text files. In addition, an XML file can be saved to record the user interface and command parameters that were specified while using the application, including object properties and settings, coordinate systems, applications, and more. RTF (Rich Text Format) is the only native file format supported by AutoCAD that allows users to store Unicode text, tables, and rich content in a file. Drawing formats The AutoCAD drawing formats, including the.dwg,.dxf,.dwf (Drawing Exchange Format), and.stp file formats are used to store drawing information. .dwg (Drawing) The.dwg file format was introduced in AutoCAD 2007 and is used for storing drawings. DWG files contain a combination of geometric data and text that defines the geometry and information needed to display and edit the objects. To display objects and edit data, AutoCAD needs to be able to retrieve the data from the file. The.dwg file format supports a large number of features, such as direct editing and hiding of layers, easy export to many native drawing formats, import of drawings from other applications, text import, and display of parametric and explicit dimensioned data. The.dwg file format was designed to be able to store the data from AutoCAD objects,

Launch Autocad from the desktop shortcut. Click the New file menu and choose Add option. Select a database location. Navigate to the location where you saved the Keygen. Type the full filename without extension. Click the Open button. Save the keygen file to a location of your choice and exit the application. Once done. Go to you Java Path. Right Click > Open command window here and type java -jar autocad.jar. You may need to put a space in between. Since we have used the JRE already earlier. If you are using the JDK. You will have to put that in first. Open the database file and edit the MProject.xml. Go to the Catalog button. Click on it. And choose Open catalog. A window will appear. Go to the File menu and choose Make New. A new catalog will be created. Navigate to the file you just made. Open it and you will see the database. Select View | Properties. You will see a number of tabs. Choose Database tab. Change database file name and location. Save the file and exit the application. Q: How to find the last row with a match to condition Let's say I have a DataFrame with two columns: col1 and col2, and I want to find all entries in which col1 is equal to 7 and col2 is equal to 4. How can I do this? My current strategy is to find the last row with col1==7 and then assign the same index to all col2 entries for which col1 is equal to 7, but I don't know how to implement that in one step. I was also wondering if there is a better way of doing this. EDIT: Let's say the dataframe looks like this col1 col2 2 7 2 7 7 7 9 8 4 8 3 7 4 As this example shows, there are several ways to reach the same result. What I would like to know is: 1) Which approach is more efficient? 2) How can I implement the solution to the first approach?
